

Coefficient

```
classDiagram
    class Coefficient {
    }
    class MobilityCoefficient {
        < MOBI >
        + MobilityCoefficient()
        + MobilityCoefficient()
        + Eval()
    }
    MobilityCoefficient --|> Coefficient
```

The diagram shows a class hierarchy. At the top is the 'Coefficient' class, represented by a rectangle with three horizontal compartments. The top compartment contains the name 'Coefficient', and the two lower compartments are empty. Below it is the 'MobilityCoefficient' class, represented by a rectangle with three horizontal compartments. The top compartment contains the name 'MobilityCoefficient' followed by the stereotype '< MOBI >'. The middle compartment is empty. The bottom compartment contains three public methods: '+ MobilityCoefficient()', '+ MobilityCoefficient()', and '+ Eval()'. A blue arrow with an open triangular head points from the 'MobilityCoefficient' class to the 'Coefficient' class, indicating that 'MobilityCoefficient' inherits from 'Coefficient'.

MobilityCoefficient
< MOBI >

+ MobilityCoefficient()
+ MobilityCoefficient()
+ Eval()
